

CASE87 - Social Housing Units 2104 Analysis

Building Level Summary

Total Levels: 4 (including a semi-basement floor)

Level 0 - Semi-Basement Floor

Vocabulary Extraction

- Housing units
- Shared laundry area
- Load-bearing walls
- Partition walls

Quantity Estimation

- Housing units estimated 2-3 (each using 2 structural bays)
- Shared laundry area 1
- Stair core 1
- Elevator 1

Spatial Relationship Descriptions

- The units are arranged at half the depth of typical floors, spanning two structural bays.
- Units connect via a central walkway adjacent to a stair/elevator core.
- Shared spaces such as laundry are embedded in circulation zones.

Overall Spatial Impression

The semi-basement integrates compact residential units with communal services, leveraging limited depth and light with efficient layout and access.

Level 1 - Typical Floor

Vocabulary Extraction

- Through-type housing units
- Walkway
- Stair core
- Elevator
- Balconies
- Load-bearing walls
- Shared lounge

Quantity Estimation

- Housing units estimated 4-5
- Balconies 1 per unit
- Shared lounge 1
- Stair core 1
- Elevator 1

Spatial Relationship Descriptions

- Units are linearly arranged along a corridor, each extending from one facade to the other for cross-ventilation.
- A shared lounge or utility space is interspersed within the circulation spine.

CASE87 - Social Housing Units 2104 Analysis

- Private and communal zones coexist along a continuous spine for spatial efficiency.

Overall Spatial Impression

This floor exhibits a modular, well-ventilated residential plan prioritizing dual-aspect orientation and community-based shared space inclusion.

Level 2 - Typical Floor

Vocabulary Extraction

- Through-type housing units
- Walkway
- Stair core
- Elevator
- Balconies
- Load-bearing walls
- Shared lounge

Quantity Estimation

- Housing units estimated 4-5
- Balconies 1 per unit
- Shared lounge 1
- Stair core 1
- Elevator 1

Spatial Relationship Descriptions

- Spatial structure mirrors Level 1, promoting vertical consistency.
- Units access daylight from both facades, creating livable and luminous interiors.
- Walkways reinforce community interaction and unit connectivity.

Overall Spatial Impression

Designed with repetition and rhythm, the floor continues the high-performing module of daylighting, openness, and efficient load-bearing distribution.

Level 3 - Attic Floor

Vocabulary Extraction

- Housing units
- Large terraces
- Walkway
- Stair core
- Elevator
- Load-bearing walls

Quantity Estimation

- Housing units estimated 2-3 (each using 2 structural bays)
- Large terraces 1 per unit
- Stair core 1
- Elevator 1

CASE87 - Social Housing Units 2104 Analysis

Spatial Relationship Descriptions

- Each unit is reduced in depth but paired with expansive private terraces.
- Units open toward the terraces to extend indoor life outdoors.
- Circulation remains anchored to the core.

Overall Spatial Impression

The attic level merges indoor housing modules with generous outdoor living, softening the vertical terminus with expansive openness and private space.

Global Spatial Analysis Summary (Cross-Levels)

Structural System:

Utilizes thickened recycled stone concrete walls (64 34 cm down the building) to reduce load incrementally with elevation; CLT slabs span the structural bays.

Design Logic:

A linear L-shaped configuration with clustered vertical cores maximizes sunlight, ventilation, and structural economy while minimizing circulation redundancy.

Material Strategy:

Based on "urban mining," the building uses 40% recycled aggregate blocks and exposed wood to assert environmental responsibility and textural warmth.

Atmosphere:

Combining coarse recycled concrete with tactile wood results in a balanced blend of rugged exterior presence and welcoming interior environments.
